

POWER SUPPLY CIRCUIT FOR
DRIVING LIQUID CRYSTAL DISPLAY DEVICE

5

ABSTRACT OF THE DISCLOSURE

10 A conventional power supply circuit has drawbacks in
that the fine adjustment of a data driver power supply
voltage cannot be achieved and that the range of a data
drive voltage changes with production variations in an
input power supply. These drawbacks are caused owing to
the fact that the operating range thereof is increased so
15 as to compensate for a change in the range which is
brought about according to a temperature characteristic
of a liquid crystal used in a liquid crystal display
device. The present invention provides a power supply
circuit that eliminates these drawbacks. The power
20 supply circuit of the present invention comprises a data
driver power circuit, which has a temperature
compensation function and a voltage regulation function,
and also comprises a scan driver power circuit that has a
function of controlling the brightness of the liquid
25 crystal display device as a user desires. The data-
driver power circuit of the power supply circuit of the
present invention has a diode group and an electric
current limiting resistor so that the data drive voltage
is 3.6 V or so at room temperature.
